

PUBLIC SCHOOL DARBHANGA

SESSION (2020-21)

CLASS-VII

NURTTION IN ANIMALS

WORKSHEET-1

1. Why do organisms take food?
2. Distinguish between a parasite and a saprophyte.
3. How would you test the presence of starch in leaves?
4. Give a brief description of the process of synthesis of food in green plants
5. Show with the help of a sketch that plants are the ultimate source of food.
6. Fill in the blanks:
 - (a) Green plants are called _____ since they synthesise their own food.
 - (b) The food synthesised by plants is stored as _____.
 - (c) In photosynthesis solar energy is absorbed by the pigment called _____.
 - (d) During photosynthesis plants take in _____ and release _____ gas.
7. Name the following:
 - i) A parasitic plant with yellow, slender and branched stem.
 - ii) A plant that is partially autotrophic.
 - iii) The pores through which leaves exchange gases.

1. Why do organisms take food?

Solution:

All organisms require energy for their life processes. Plants prepare their food and acquire nutrients from abiotic components like soil, air, water and sunlight. On the other hand, animals need to get food from either plants or other animals to obtain nutrients; hence animals need to take food to acquire nutrients and energy.

2. Distinguish between a parasite and a saprophyte.

Solution:

Saprophytes	Parasites
Acquire nutrients from dead and decaying matter	Parasites live on or in a host and get its food at the expense of its host
Example: Fungi	Example: roundworm

3. How would you test the presence of starch in leaves?

Solution:

Take two potted plants of the same kind. Keep one in the dark for 72 hours and the other in sunlight. Perform the iodine test with the leaves of both the plants as given below. Now leave the pot which was earlier kept in the dark, undisturbed for 3 – 4 days and perform the iodine test again on its leaves.

Iodine test:

Put iodine solution on the leaf

Observation:

Blue-black colour will be observed on the leaves of the plant kept in sunlight, which indicates the presence of starch.

Blue-black colour will not be observed on the leaves of plant kept in the darkroom. This indicates the absence of starch.

4. Give a brief description of the process of synthesis of food in green plants

Solution:

Green plants use a process called as photosynthesis to prepare their food. The process is as follows

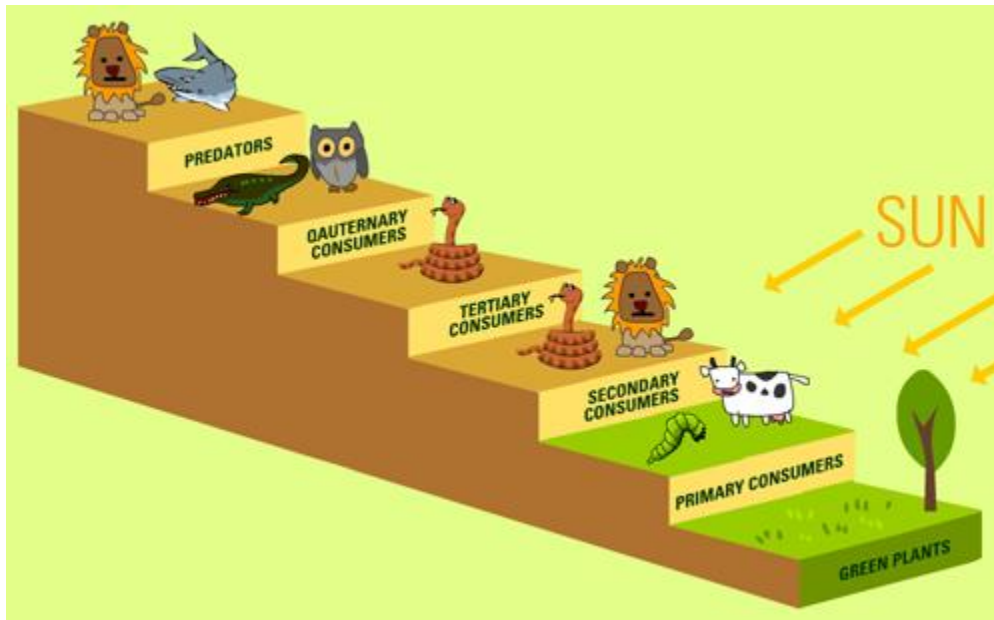

- Water is taken from the roots of the plant, and it is transported to leaves of the plant.
- Carbon dioxide from air enter the leaves through pores called stomata. This diffuses the cell containing chlorophyll.
- Water molecule is broken down into Hydrogen and Oxygen with the help of sunlight.

- Hydrogen combines with Oxygen and Hydrogen to form carbohydrates.
- Photosynthesis is represented by the following equation.

5. Show with the help of a sketch that plants are the ultimate source of food.

Solution:

6. Fill in the blanks:

- Green plants are called _____ since they synthesise their own food.
- The food synthesised by plants is stored as _____.
- In photosynthesis solar energy is absorbed by the pigment called _____.
- During photosynthesis plants take in _____ and release _____ gas.

Solution:

- Green plants are called **autotrophs** since they synthesise their food.
- The food synthesised by plants is stored as **starch**.
- In photosynthesis, solar energy is absorbed by the pigment called **chlorophyll**.
- During photosynthesis, plants take in **Carbon dioxide** and release **Oxygen** gas.

7. Name the following:

i) A parasitic plant with yellow, slender and branched stem.

ii) A plant that is partially autotrophic.

iii) The pores through which leaves exchange gases.

Solution:

i) Cuscuta

ii) Pitcher plant

iii) Stomata
